

Dental Security Assessment Summary

Version 1 — April 9, 2026

Date	2026-04-09	Author	Bromley Security Team	Product	DENTAL / DENCLASS
------	------------	--------	-----------------------	---------	-------------------

This summary records the initial security posture for the Dental FHIR integration path as of the Sprint 2 review.

Scope

- FHIR endpoint package for referral workflow exchange
- Named-user sandbox access assumptions
- Authentication, audit, and data-handling review points

Current Assessment

- Endpoint inventory is materially complete but not yet final.
- Authentication model is understood at a high level, but sandbox evidence is incomplete.
- The biggest non-security risk affecting security confidence is environment instability, not a discovered control failure.

Open Concerns

- Named-user credential timing remains uncertain.
- Integration evidence is below the threshold expected for strong readiness claims.
- One legacy referral-history field still needs final handling guidance.

Near-Term Recommendations

- Freeze the endpoint inventory for formal review.
- Document compensating controls for any path validated with mock services.
- Update the assessment after the next leadership sync if the environment path changes.
