

Dental Security Assessment Summary

Version 2 — April 12, 2026

Date	2026-04-12	Author	Bromley Security Team	Product	DENTAL / DENCLASS
------	------------	--------	-----------------------	---------	-------------------

This revision reflects the leadership-directed mitigation strategy and the new expectation that partial sandbox access may arrive before full environment readiness.

What Changed Since v1

- Leadership approved staged mitigation rather than waiting passively for full vendor recovery.
- The team may validate some flows in a partial sandbox and use mock services for controlled gaps.
- Reporting must distinguish validated scope from mitigation-backed scope.

Assessment Update

- No new control failure was introduced by the mitigation path.
- However, the evidence model becomes more important because not every path will be validated the same way on the same date.
- Any leadership report should explain that improved posture depends on corroborating evidence from transcripts, weeklys, ADO, and updated risk artifacts.

Required Controls

- Track exactly which capabilities are validated in the partial sandbox.
- Capture owner-approved compensating controls for mock-service demonstrations.
- Refresh the assessment again after vendor recovery milestones are confirmed in writing.

Risk Interpretation

- The product remains operationally at risk, but the security posture is now better documented and more governable than it was on April 9.

Synthetic demo artifact created for the EIDS Product Knowledge Hub prototype pack.
